

Several years ago we have introduced methods for estimating the healthy life years lost (HLYL) from only mortality and population data based on the assumption that the health state information, usually investigated by questionnaires, was also included into the death-population information from the life tables. The advantage of our methods further to avoid the costly and time consuming surveys and data collection provides immediately the results from only the life table data, is more accurate with shorter confidence intervals, while may apply in any period of time as far as life tables are provided.

Thanks to the excellent and systematic work of the Human Mortality Database (HMD) group providing Life Tables for 39 countries, it was possible to construct this Excel Spreadsheet to estimate the Healthy Life Expectancy (HLE) and the Healthy Life Years Lost (HLYL) based on a theory developed and published in our Monograph (Exploring the Health State of a Population by Dynamic Modeling Methods, Springer 2018, <http://www.springer.com/us/book/9783319651415>). We use 4 methods based on a direct methodology of estimation from mx and qx and 2 non-linear regression fit methods based on mx and by applying the Gompertz and Weibull equations. The provided HLYL is the average of the 4 estimates (for high infant mortality cases the Gompertz and Weibull methods should be excluded).

By "copy and paste" the Life Tables along with the confidence intervals. The data from a 0-100 year life table. Life expectancy (HALE) provided by the World Bank. The results are comparable with the latest HALE provided by the World Bank.

Estimation of Healthy Life Expectancy (HLE) via 4 methods based on Direct Method (mx and qx) and Gomperz and Weibull

Estimates of HLYL and HLE (C H Skiadas and C Skiadas, 2016).

Add data from A4:A116 to M4:M116 in this Excel file and do not change the supporting files Gompertz and Weibull as they run automatically

Manually complete all the Life Table from the Human Mortality Database, HMD (recommended).

See and import data from column BE and more,...or download from www.mortality.org

Healthy Life Years Lost (HLYL)

HLYL Gompertz	HLYL Weibull	HLYL from mx	HLYL from qx	HLYL Average
9.12	9.12	9.37	8.75	9.09
